What's the complexity? Quantum Advantage?

- **Classical computer with 1 MAC**

Time: $O(N)$

Space (Comp. Res.): $O(1)$

Time \times Space: $O(N)$

- **Classical computer with N MAC**

Time: $O(1)$

Space (Comp. Res.): $O(N)$

Time \times Space: $O(N)$

- **Time-Space Complexity in Quantum computer**

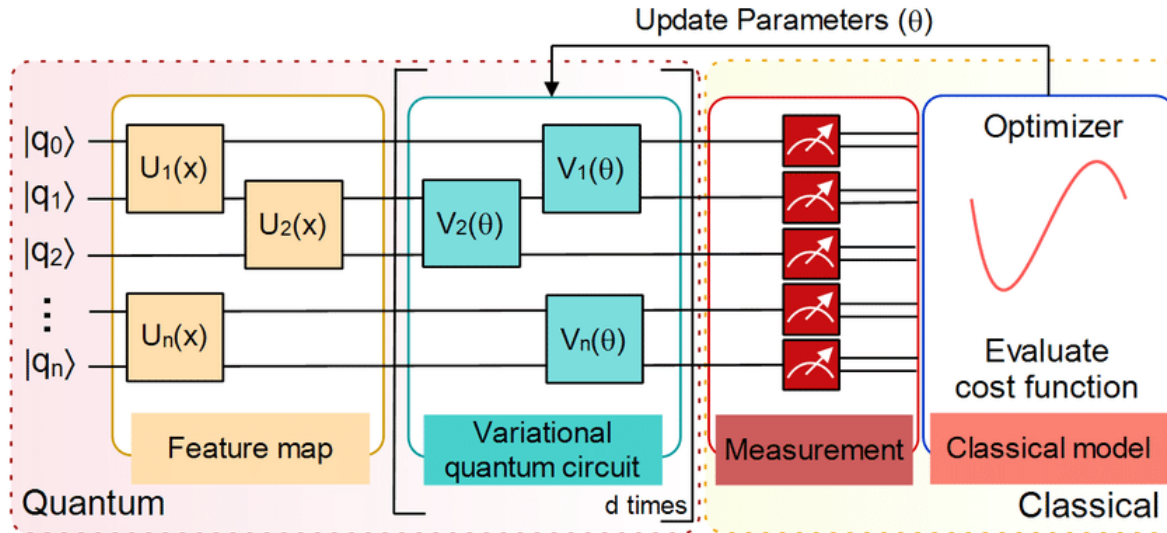

Time: Circuit Length

Space (Comp. Res.): Qubits

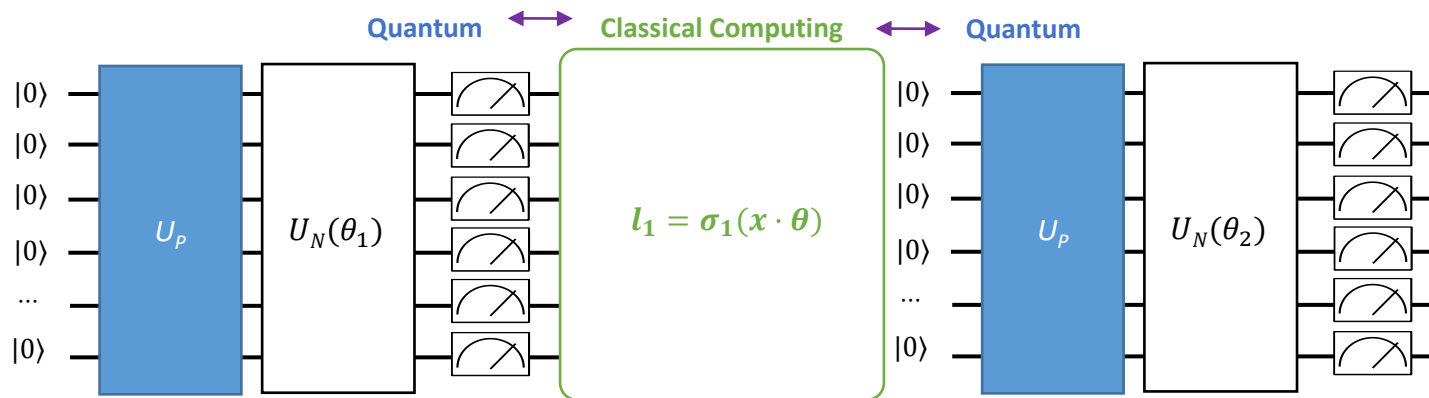

Time \times Space ($T - S$): Qubits \times Circuit Length

- **Given that $T - S$ complexity on classical computer is $O(N)$, Quantum Advantage is achieved if $T - S$ complexity on Quantum can be $O(\text{polylog}N)$ or lower. ----- Exponential Speedup!**

Two Paths of Quantum Machine Learning: Path 1 --- VQC

[ref] Sen, P., Bhatia, A.S., Bhangu, K.S. and Elbeltagi, A., 2022. Variational quantum classifiers through the lens of the Hessian. Plos one, 17(1), p.e0262346.

Pros:

- Easy to implement

Cons:

- On intermediate-scale quantum devices, no works show that **performance** of QML can beat classical ML, so far.
- Have no **non-linear** in the network
- Incur **heavy overhead** for **non-linearity**

Two Paths of Quantum Machine Learning: Path 2 --- Q Accelerator

CPU/GPU
Accelerator

FPGA/ASIC
Accelerator

Quantum
Accelerator

Pros:

- Same Performance as Classical ML

Questions:

- How to design?
- Advantage?

What's the Goals?

Input features	Number of Qubits	Number of Gates
$U(x)$	$O(\log N)$	$O(?)$
$U(W)$	$O(\log N)$	$O(?)$
$U(N)$	$O(1)$	$O(\log N)$

n : input data number
Potential Quantum Advantage

What's the Goals?

Goal 1: **Correctly** Implement!

Goal 2: **Efficiently** Implement!

$$O = \delta \left(\sum_{i \in [0, N)} x_i \times W_i \right)$$

where δ is a quadratic function

Classical Computing:

Complexity of **$O(N)$**

Quantum Computing:

Can we reduce complexity to

$O(\text{polylog} N)$, say **$O(\log^2 n)$** ?

Goal 3: **Scale-Up!**

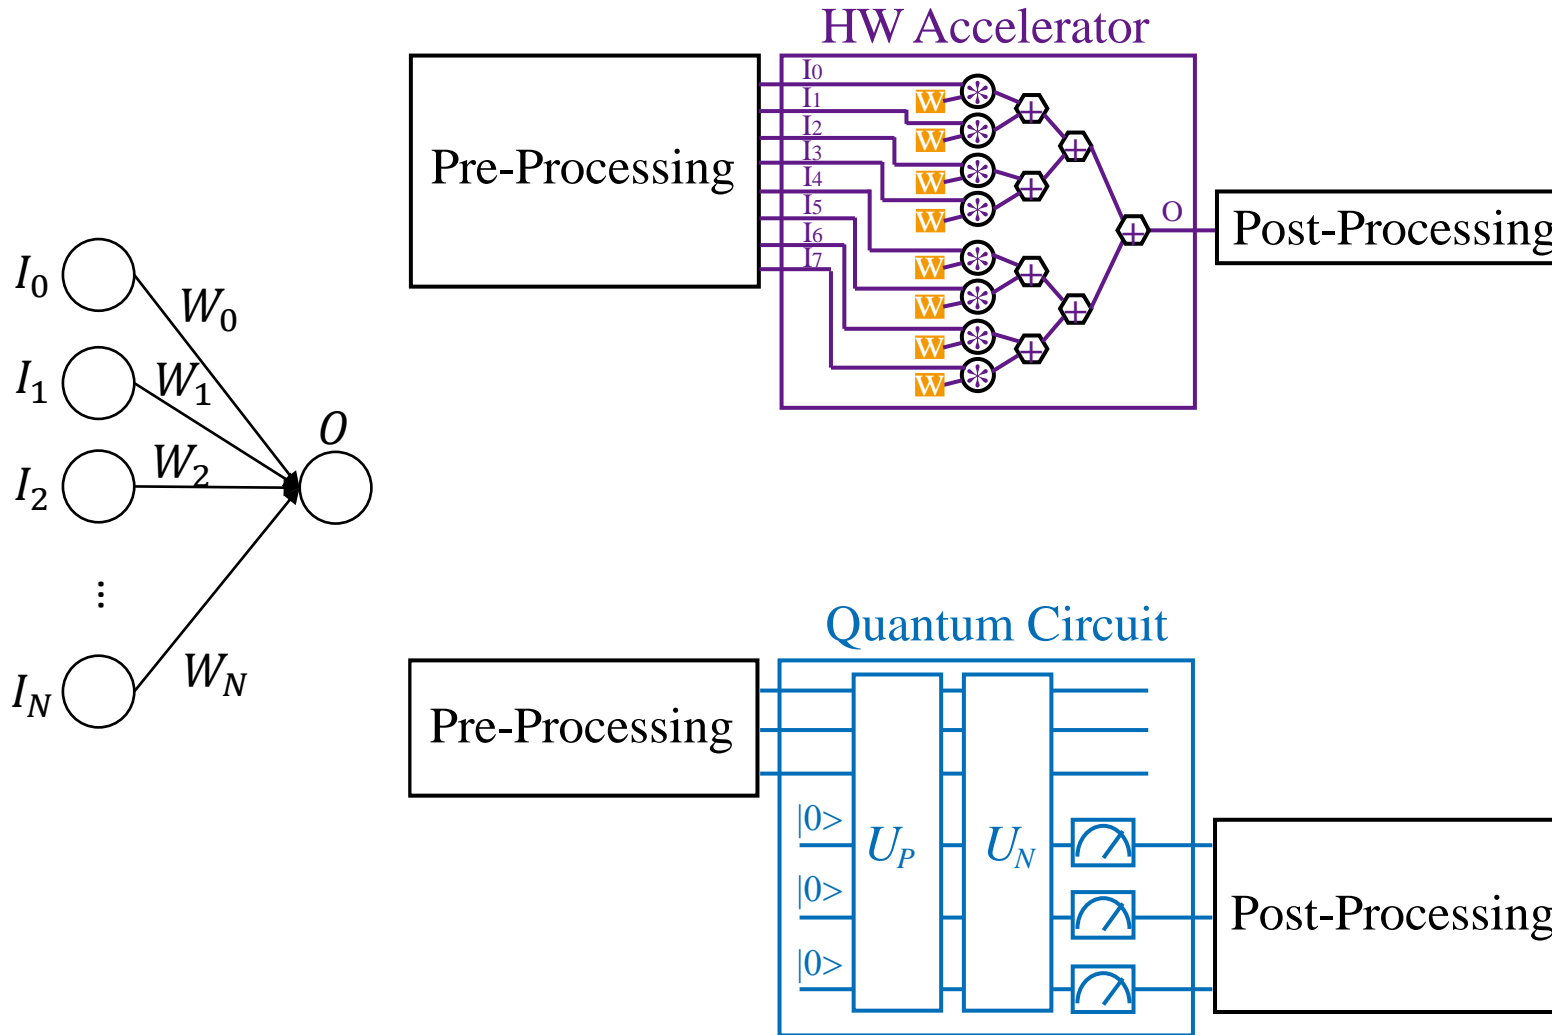

Agenda – Session 3: QuantumFlow

Neural Network Accelerator Design on Classical Hardware

Neural Network Accelerator Design from Classical to Quantum Computing

- (1) Data Pre-Processing (*PreP*)
- (2) HW Acceleration
- (3) Data Post-Processing (*PostP*)

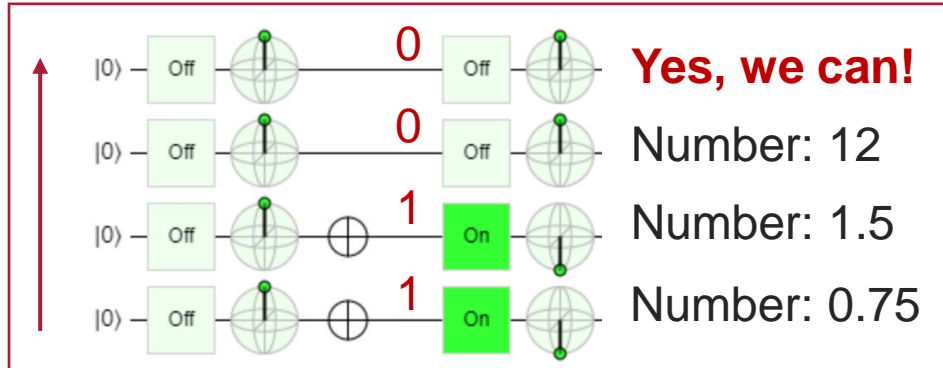

- (1) Data Pre-Processing (*PreP*)
- (2) HW/Quantum Acceleration
 - (2.1) U_p Quantum-State-Preparation
 - (2.2) U_N Quantum Neural Computation
 - (2.3) M Measurement
- (3) Data Post-Processing (*PostP*)

$$\mathbf{PreP + U_p + U_N + M + PostP}$$

What Data Can Be Encoded to Quantum Computers, and how?

- Can we encode an arbitrary number into quantum computer? Is it efficient?

▪ **Yes / No**

No, because it uses too many qubits!

This encoding is similar to classical bits, where each qubit is regarded as a binary number!

1-to-N mapping! (Boolean Function)

What Data Can Be Encoded to Quantum Computers, and how?

- Can we encode an arbitrary number into quantum computer? Is it efficient?

▪ Yes / No

No, because it uses too many qubits!

This encoding is similar to classical bits, where each qubit is regarded as a binary number!

1-to-N mapping! (Boolean Function)

- Can we take use of superposition of qubits to encode data? Is this solution perfect?

▪ Yes / No

No, (1) data needs in the range of $[0,1]$!

(2) same complexity $O(1)$ as classical

1-to-1 mapping! (Angle Encoding)

What Data Can Be Encoded to Quantum Computers, and how?

Hands-On: QuantumFlow

A Co-Design Framework of Neural Networks and Quantum Circuits Towards Quantum Advantage

Published at Nature Communications 2021

Presenter: Zhepeng Wang

PreP + U_P + U_N + M + *PostP*: Data Pre-Processing

- **Given:** (1) 28×28 image, (2) the number of qubits to encode data (say $Q=4$ qubits in the example)
- **Do:** (1) downsampling from 28×28 to $2^Q = 16 = 4 \times 4$; (2) converting data to be the state vector in a unitary matrix
- **Output:** A unitary matrix, $M_{16 \times 16}$

Step 1: Downsampling

From 28×28 to 4×4

$$\begin{bmatrix} 0.0039 & 0.2118 & 0.2941 & 0.0275 \\ 0.0039 & 0.2784 & 0.5961 & 0.0667 \\ 0.0863 & 0.3176 & 0.5216 & 0.0588 \\ 0.1137 & 0.3608 & 0.1725 & 0.0039 \end{bmatrix}$$

$$\begin{bmatrix} 0.0039 & 0.2118 & 0.2941 & 0.0275 \\ 0.0039 & 0.2784 & 0.5961 & 0.0667 \\ 0.0863 & 0.3176 & 0.5216 & 0.0588 \\ 0.1137 & 0.3608 & 0.1725 & 0.0039 \end{bmatrix}$$

Step 2: Formulate Unitary Matrix

**Applying SVD method
(See Listing 1 in ASP-DAC SS Paper)**

Unitary matrix: $M_{16 \times 16}$

[SS] W. Jiang, et al. [When Machine Learning Meets Quantum Computers: A Case Study](#), ASP-DAC'21

PreP + U_P + U_N + M + *PostP* --- Data Encoding / Quantum State Preparation

- **Given:** The unitary matrix provided by *PreP*, $M_{16 \times 16}$
- **Do:** Quantum-State-Preparation, encoding data to qubits
- **Verification:** Check the amplitude of states are consistent with the data in the unitary matrix, $M_{16 \times 16}$

Let's use a 2-qubit system as an example to encode a matrix $M_{4 \times 4}$

State Transition:

$$\begin{bmatrix} \mathbf{0.2343} & X & X & X \\ \mathbf{0.3904} & X & X & X \\ \mathbf{0.5466} & X & X & X \\ \mathbf{0.7028} & X & X & X \end{bmatrix} \times \begin{bmatrix} 1 \\ 0 \\ 0 \\ 0 \end{bmatrix} = \begin{bmatrix} \mathbf{0.2343} \\ \mathbf{0.3904} \\ \mathbf{0.5466} \\ \mathbf{0.7028} \end{bmatrix}$$

IBM Qiskit Implementation:

```
inp = QuantumRegister(4, "in_qubit")
circ = QuantumCircuit(inp)
iniG = UnitaryGate(data_matrix, label="input")
circ.append(iniG, inp[0:4])
```

Hands-On Tutorial (1)

PreP + U_p

Agenda – Session 3: QuantumFlow

- **General Framework for Quantum-Based Neural Network Accelerator**
 - Data Preparation and Encoding
 - *Colab Hands-On (1): From Classical Data to Quantum Data*
 - Quantum Circuit Design
 - *Colab Hands-On (2): A Quantum Neuron*
- **Co-Design toward Quantum Advantage**
 - Challenges?
 - Feedforward Neural Network
 - Optimization for Quantum Neuron
 - Results
 - *Colab Hands-On (3): End-to-End Neural Network on MNIST*
 - *Colab Hands-On (4): QuantumFlow*
 - *Colab Hands-On (5): Comparison*

PreP + U_P + U_N + *M* + *PostP* --- Neural Computation

- **Given:** (1) A circuit with encoded input data x ; (2) the trained binary weights w for one neural computation, which will be associated to each data.
- **Do:** Place quantum gates on the qubits, such that it performs $\frac{(x*w)^2}{\|x\|}$.
- **Verification:** Whether the output data of quantum circuit and the output computed using torch on classical computer are the same.

Target: $O = \left[\frac{\sum_i (x_i \times w_i)}{\sqrt{\|x\|}} \right]^2$

- **Assumption 1:** Parameters/weights (W_0 --- W_N) are binary weight, either +1 or -1
- **Assumption 2:** The weight $W_0 = +1$, otherwise we can use $-w$ (quadratic func.)

Step 1: $m_i = x_i \times w_i$

Step 2: $n = \left[\frac{\sum_i (m_i)}{\sqrt{\|x\|}} \right]$

Step 3: $O = n^2$

Quantum Neuron Design: Step 1

Step 1: $m_i = x_i \times w_i$

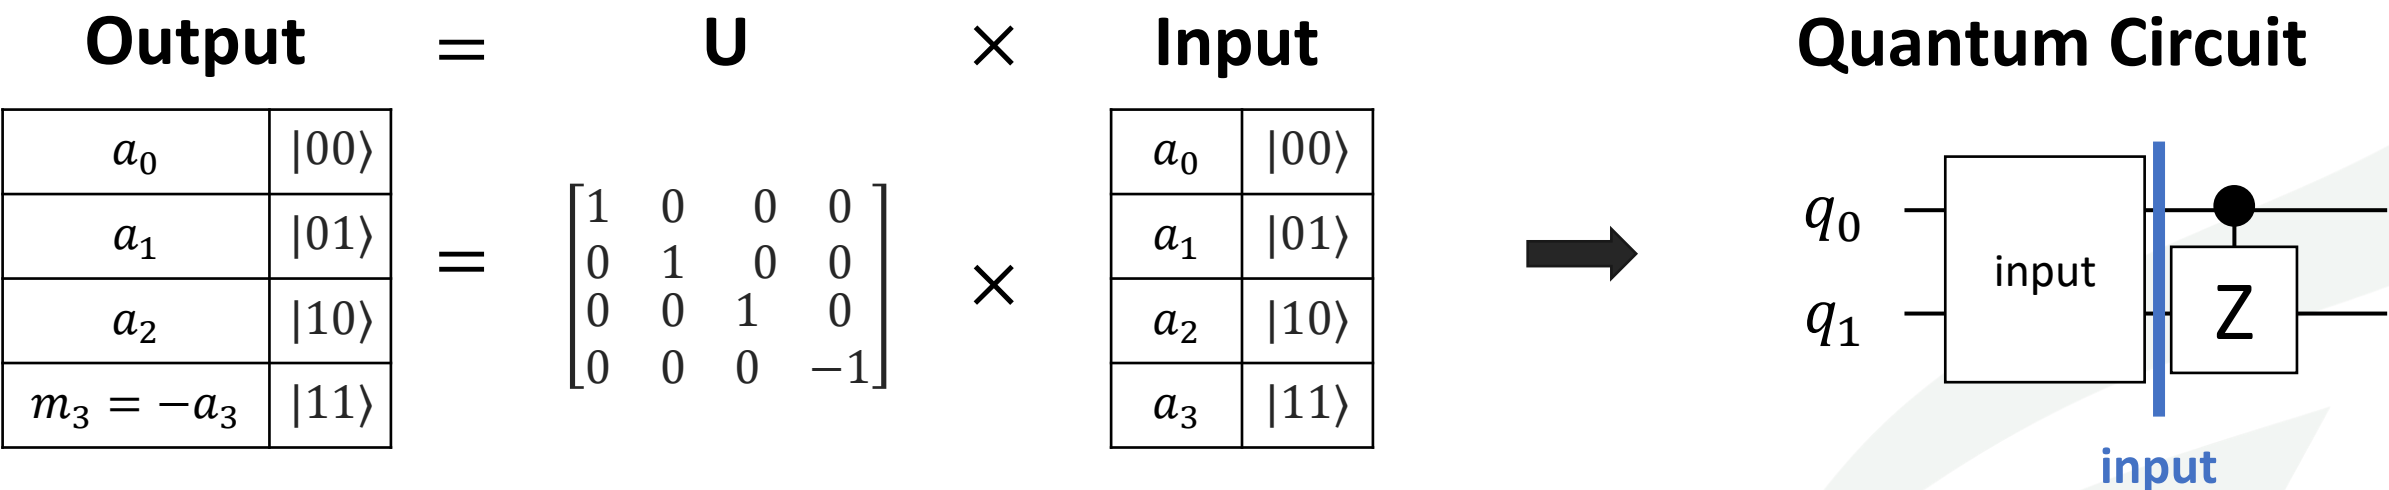

EX: 4 input data on 2 qubits

$$x = \begin{bmatrix} a_0 \\ a_1 \\ a_2 \\ a_3 \end{bmatrix}$$

$$w = \begin{bmatrix} w_0 \\ w_1 \\ w_2 \\ w_3 \end{bmatrix}$$

$w_0 = 1$
 $w_1 = 1$
 $w_2 = 1$
 $w_3 = -1$

$m_3 = -1 \times a_3 = -a_3$

$PreP + U_P + \mathbf{U}_N + M + PostP$ --- Neural Computation: Step 1

Step 1: $m_i = x_i \times w_i$

EX: 4 input data on 2 qubits

$$w = \begin{bmatrix} +1 \\ +1 \\ +1 \\ -1 \end{bmatrix} \text{ or } \begin{bmatrix} +1 \\ +1 \\ -1 \\ -1 \end{bmatrix} \text{ or } \begin{bmatrix} +1 \\ -1 \\ -1 \\ -1 \end{bmatrix} \text{ or } \begin{bmatrix} +1 \\ +1 \\ -1 \\ +1 \end{bmatrix} \text{ or } \begin{bmatrix} +1 \\ -1 \\ -1 \\ +1 \end{bmatrix} \text{ or } \begin{bmatrix} +1 \\ -1 \\ +1 \\ +1 \end{bmatrix}$$

Flip the sign of $|11\rangle$

Flip the sign of $|01\rangle$

Flip the sign of $|10\rangle$

Quantum Neuron Design: Step 2

Step 2: $n = \left\lceil \frac{\sum_i(m_i)}{\sqrt{\|x\|}} \right\rceil$

EX: 4 input data on 2 qubits

Output

=

U

×

Input

$\sum_i(m_i) / \sqrt{\ x\ }$	$ 00\rangle$
Do not care 1	$ 01\rangle$
Do not care 2	$ 10\rangle$
Do not care 3	$ 11\rangle$

=
$$\frac{1}{\sqrt{\|x\|}} \begin{bmatrix} 1 & 1 & 1 & 1 \\ * & * & * & * \\ * & * & * & * \\ * & * & * & * \end{bmatrix} \times$$

note: $\|x\| = 2^N$

m_0	$ 00\rangle$
m_1	$ 01\rangle$

Co-Design Framework

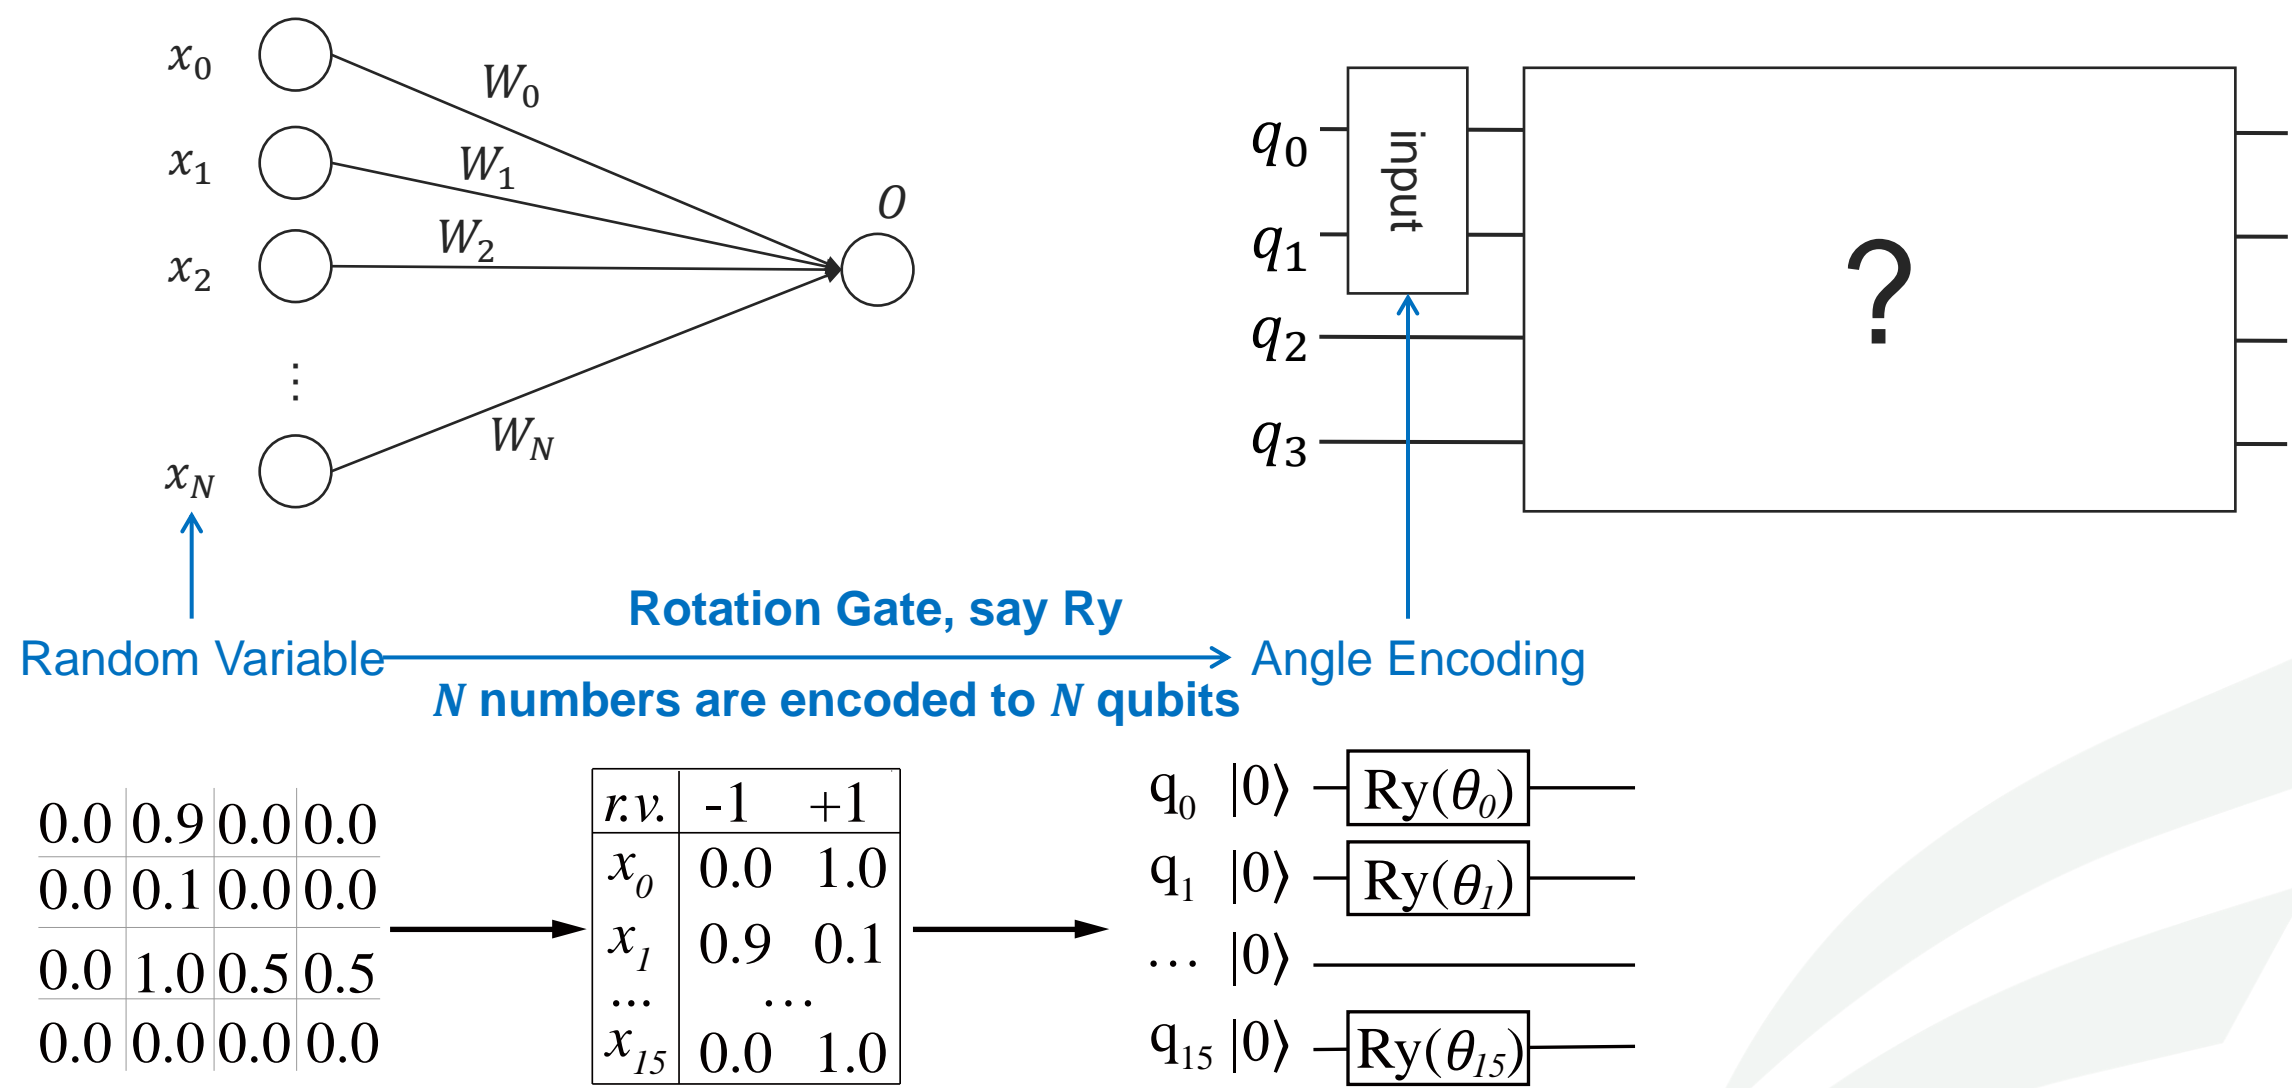

Design Direction 1: NN \rightarrow Quantum Circuit

Design Direction 2: Quantum Circuit → NN

Design Direction 3: NN → Quantum Circuit

Apply Our Framework to Address Challenges 1 & 2 (non-linear & Q-C comm.)

- (1) Data Pre-Processing (*PreP*)
- (2) HW/Quantum Acceleration
 - (2.1) rvU_p Quantum-State-Preparation
 - (2.2) rvU_N Quantum Neural Computation
 - (2.3) M Measurement
- (3) Data Post-Processing (*PostP*)

rvU_P --- Data Encoding / Quantum State Preparation

- **Given:** A vector of input data, ranging from $[0,1]$ (do scaling in *PreP* if range out of $[0,1]$)
- **Do:** Applying rotation gate to encode each data to one qubits
- **Output:** A quantum circuit, where the probability of each qubit to be $|1\rangle$ is the same as the corresponding input data

Determination of θ_i :

$$\theta_i = 2 \times \arcsin(\sqrt{x_i})$$

$$|\psi\rangle = \cos\frac{\theta}{2} |0\rangle + (\cos\phi + i \cdot \sin\phi) \cdot \sin\frac{\theta}{2} |1\rangle$$

rvU_N --- Neural Computation

- **Given:** (1) A circuit with encoded input data x ; (2) the trained binary weights w for one neural computation, which will be associated to each data.
- **Do:** Place quantum gates on qubits, such that it performs $\frac{(x*w)^2}{\|x\|^2}$, where x are random variables

Target: $O = \left[\frac{\sum_i (x_i \times w_i)}{\|x\|} \right]^2$

- **Assumption 1:** Parameters/weights (W_0 --- W_N) are binary weight, either +1 or -1
- **Assumption 2:** The weight $W_0 = +1$, otherwise we can use $-w$ (quadratic func.)

Step 1: $m_i = x_i \times w_i$

Step 2: $n = \left[\frac{\sum_i (m_i)}{\|x\|} \right]$

Step 3: $O = n^2$

rvU_N --- Neural Computation: Step 1

Step 1: $m_i = x_i \times w_i$

EX: 4 input data on 4 qubits

rvU_N --- Neural Computation: Step 2

$$\text{Step 2: } n = \left\lfloor \frac{\sum_i(m_i)}{\|x\|} \right\rfloor$$

EX: 2 input data on 2 qubits

Implementing Feedforward Net w/ Non-Linearity, w/o Measurement!

Agenda – Session 3: QuantumFlow

- General Framework for Quantum-Based Neural Network Accelerator
 - Data Preparation and Encoding
 - *Colab Hands-On (1): From Classical Data to Quantum Data*
 - Quantum Circuit Design
 - *Colab Hands-On (2): A Quantum Neuron*
- **Co-Design toward Quantum Advantage**
 - Challenges?
 - Feedforward Neural Network
 - **Optimization for Quantum Neuron**
 - Results
 - *Colab Hands-On (3): End-to-End Neural Network on MNIST*
 - *Colab Hands-On (4): QuantumFlow*
 - *Colab Hands-On (5): Comparison*

Challenge 3: High Complexity in the Previous Design

Cost Complexity

Classical Computing		
	No Parallelism	Full Parallelism
Time (T)	$O(N)$	$O(1)$
Space (S)	$O(1)$	$O(N)$
Cost (TS)	$O(N)$	$O(N)$

Quantum Computing		
	Previous Design	Optimization
Circuit Depth (T)	$O(N)$???
Qubits (S)	$O(\log N)$	$O(N)$ <i>$\log N$</i>
Cost (TS)	$O(N \cdot \log N)$	target $O(\text{polylog } N)$

QuantumFlow: Taking NN Property to Design QC

$[0, 0.9, 0, 0, 0, 0.1, 0, 0, 1.0, 0.5, 0.5, 0, 0, 0, 0]^T$

QuantumFlow: Taking NN Property to Design QC

Property from NN

- The **weight order** is not necessary to be fixed, which can be adjusted if the order of inputs are adjusted accordingly
- **Benefit:** No need to require the positions of sign flip are exactly the same with the weights; instead, only need the number of signs are the same.

$$S1 = [0, 0.59, 0, \text{0}, \text{0}, 0.07, 0, 0, 0.66, \text{0.33}, \text{0.33}, 0, 0, 0, 0]^T$$

$$S1' = [0, 0.59, 0, \mathbf{0.33}, \mathbf{0.33}, 0.07, 0, 0, 0.66, \mathbf{0}, \mathbf{0}, 0, 0, 0, 0]^T$$

QuantumFlow: Taking NN Property to Design QC

Algorithm 4: QF-Map: weight mapping algorithm

Input: (1) An integer $R \in (0, 2^{k-1}]$; (2) number of qubits k ;

Output: A set of applied gate G

```
void recursive(G,R,k){
    if ( $R < 2^{k-2}$ ){
        recursive(G,R,k - 1); // Case 1 in the third step
    }
    else if ( $R == 2^{k-1}$ ){
         $G.append(PG_{2^{k-1}})$ ; // Case 2 in the third step
        return;
    }else{
         $G.append(PG_{2^{k-1}})$ ;
        recursive( $G, 2^{k-1} - R, k - 1$ ); // Case 3 in the third step
    }
}
// Entry of weight mapping algorithm
set main(R,k){
    Initialize empty set  $G$ ;
    recursive( $G, R, k$ );
    return  $G$ 
}
```

Used gates and Costs

Gates	Cost
Z	1
CZ	1
C^2Z	3
C^3Z	5
C^4Z	6
...	...
C^kZ	$2k-1$

Worst case: all gates

$O(k^2)$
